

Eindverslag Stage 3devo

Verwarmde behuizing voor het 3D-printen van HDPE en PP
door
Luca van Straaten (18073611)

Dit document is opgesteld voor de stage bij 3devo. Luca van Straaten is een student Elektrotechniek aan de Haagse Hogeschool te Delft.

Datum: 1 februari 2022
Versie: 2.0

WIJZIGINGEN

Herziening	Datum	Auteur(s)	Beschrijving
V0.1	08.09.2021	Luca	Document aangemaakt

V1	17.11.2021	Luca	Eerste oplagen

VOORWOORD

Dit ontwerpdocument is geschreven als documentatie van het eerste stagetraject van Luca van Straaten.

Dank gaat naar 3devo voor de mogelijkheid om bij hun mijn eerste stage te doen.

Dit verslag is bedoeld voor mijn stage beoordeler om te beoordelen of ik voldoende heb gepresteerd tijdens mijn stage, voor 3devo en de mensen die daar werken en verder moeten bouwen op mijn werk en voor Nederlandstalige geïnteresseerden in het project. Een Engels vertaalde versie van dit verslag is momenteel niet beschikbaar.

Utrecht, November 2021

INLEIDING

Waar de reden tot creatie van dit verslag worden blootgelegd, de opdracht en het probleem worden beschreven en achtergrondinformatie wordt gegeven.

De opdracht is om aanstuur elektronica te maken voor een 3D-printer die HDPE en PP moet kunnen printen. Deze printer is ongebruikelijk omdat deze een verwarmde kamer krijgt die tot 160 °C moet kunnen komen. De hypothese is dat een verwarmde werkruimte van een dusdanig hoge temperatuur, de problemen oplost die worden bevonden met het printen van HDPE en PP met een conventionele printer.

1 WAT IS 3D-PRINTEN

3D-printen is een additieve productie (AM) methode. Dat betekent dat een product word opgebouwd vanaf nul, in tegenstelling tot subtractieve productie is er weinig of geen verlies van materiaal. Een andere vorm van additieve productie is bijvoorbeeld sputtigieten, maar hierbij zijn kostbare gietmallen nodig. 3D-printen vereist geen grote investering voor elk nieuw ontwerp, en is daarom uitermate geschikt om snel prototypen te maken. [2]

1.1 FDM 3D-PRINTEN

Er zijn verschillende vormen van 3D-printen, maar verreweg de meest populaire bij hobbyisten en kleinschalige bedrijven is FDM 3D-printen. FDM staat voor Fused Deposition Modeling, hierbij word steeds een laag materiaal op de vorige laag neergelegd (depositie) en daar op vast gesmolten (gefuseerd). Door herhaaldelijk laagjes op elkaar neer te leggen kan een 3D object worden opgebouwd. Het plastic word gesmolten in het hotend en word door de extruder uit het hotend geperst.

1.2 3D-PRINTER SOFTWARE

Er is verschillende software en firmware nodig om te kunnen 3D printen. Wat voor soorten software dat is staat hier onder beschreven.

3D BESTANDEN

Software is nodig om een 3D object te ontwerpen, tijdens dit project is daarvoor f360 gebruikt. Ook kunnen bepaalde 3D objecten worden gedownload van [Thingiverse](#). Dit zijn meestal stl en 3mf bestanden.

Inleiding

SLICER

Gedurende dit project is de slicer *Prusaslicer* gebruikt, alle settings die gebruikt zijn om te slicen zijn op GitHub bijgehouden. Een slicer is software die een 3D bestand als een stl of 3mf, omzet in een hoop 2D lagen. Elke laag is gebruikelijk rond de 0.2 mm hoog. De printer *tekent* deze lagen en stapelt ze op elkaar, zo word een 3D object opgebouwd. In de slicer kan je veel dingen instellen om print kwaliteit of print snelheid te verbeteren. Instellingen zoals snelheid, temperatuur, flowrate en een hoop meer kun je tweaken voor een beter resultaat, deze instellingen zijn meestal printer afhankelijk.

1.3 3D-PRINTER FIRMWARE

Firmware is een specifieke klasse van computersoftware die de controle op laag niveau biedt voor de specifieke hardware van een apparaat. Voor minder complexe apparaten (zoals 3D-printers) kan firmware fungeren als het complete besturingssysteem van het apparaat.

Een veel gebruikte firmware voor 3D-printers is Marlin en dat is ook waar voor is gekozen voor deze 3D-printer. Marlin is een open source firmware voor de RepRap-familie van 3D-printers. Het is afgeleid van Sprinter en grbl en werd een op zichzelf staand open source project op 12 augustus 2011 met de Github-release. Marlin heeft een licentie onder GPLv3 en is gratis voor alle toepassingen [3].

COMPILER

Een compiler word gebruikt om de firmware van de 3D-printer die in C++ is geschreven, om te zetten naar machinetaal. Machinetaal kan op de microprocessor worden uitgevoerd. Voor het compileren van Marlin is *Auto Build Marlin* een goede optie [4].

2 WAT ZIJN HDPE EN PP

HDPE is een hoge dichtheid variant van PE. PE is een thermoplastisch polymer dat in een breed scala aan toepassingen wordt gebruikt. HDPE is dus ook een thermoplast dat kan worden geëxtrudeerd.

PP is tegenwoordig een van de meest gebruikte plastics. Het is een polymer dat voornamelijk wordt gebruikt voor verpakkingen. HDPE is een thermoplast dat kan worden geëxtrudeerd. Het wordt geproduceerd via ketengroei-polymerisatie uit het monomeer propyleen.

2.1 WAAROM HDPE EN PP

HDPE en PP hebben een aantal gunstige eigenschappen die ervoor zorgen dat het makkelijk te bewerken is. Daarom is de meerderheid van de gebruikte plastics voor verpakkings-materiaal gemaakt van HDPE en PP. Omdat een grote hoeveelheid van de afvalstroom daarom ook uit HDPE en PP bestaan is het gunstig om dat te kunnen recyclen om mee te 3D-printen.

Inleiding

3 BESTANDEN DOWNLOADEN

Dit hele project is gewerkt in en is vastgelegd in Git. Maar omdat de inhoud van het project en verslag intellectueel eigendom is van 3devo, staat dat openbaar op GitHub. Voor vragen over de inhoud van het project kun je contact opnemen met lucavanstraaten@icloud.com

1 ANALYSE VAN HET PROBLEEM

Waar de noodzaak van dit project word blootgelegd.

Kortweg is het probleem dat er momenteel niet met HDPE en PP kan worden ge-3D-print. 3D-printen met HDPE en PP is wenselijk omdat deze materialen overvloedig zijn is de huidige afvalstroom, en ze dus goedkoop te verkrijgen zijn.

Een voorbeeld van hoogwaardig PP in de afvalstroom zijn verpakkingen van medische goederen in ziekenhuizen. 3devo heeft PP bakjes van een oogheelkunde kliniek en wil dat recyclen tot 3D-printer filament. Zie Figuur 1.1 voor de bakjes.

Figuur 1.1: PP bakjes van een oogheelkunde kliniek

1.1 WAAROM IS EEN SPECIALE 3D-PRINTER NODIG

Er zijn twee redenen gegeven waarom een speciale printer nodig is voor het printen met HDPE en PP. Tests zijn uitgevoerd om vast te stellen of deze complicaties werkelijk het printen van HDPE en PP onmogelijk maken.

1.1.1 PRINTEN OP EEN CONVENTIONELE 3D-PRINTER

Er is een test uitgevoerd met het printen van HDPE en PP. Deze test zijn uitgevoerd op een conventionele FDM 3D-printer, namelijk een Ender-3. De slicer settings die gebruikt zijn waren vooral getweakt op temperatuur en snelheid.

1 Analyse van het probleem

Figuur 1.2: Test print met HDPE op een conventionele printer

Figuur 1.3: Test print met PP op een conventionele printer

LAAG HECHTING

De hypothese is dat bij het printen met PP de laag hechting niet goed zal zijn. Dat komt doordat PP onder de kristallisatieterminatuur niet "plakkerig" is. De test met het printen van PP heeft geconcludeerd dat die hypothese waar is. Het materiaal blijft moeilijk plakken aan het bed, en als dat goed ging, blijft het ook nauwelijks plakken aan zichzelf. Zie Figuur 1.3. Een ander probleem met het printen van PP is dat het flexibele plastic niet goed door een bowden extruder gaat vanwege de extra weerstand in dat systeem. Uitleg over wat een bowden tube extruder is staat in hoofdstuk 4.1.1.

KROM TREKKEN

De verwachting was dat het grote probleem met HDPE is dat het krom trekt tijdens het printen. Tijdens het printen zal er een warmte gradiënt ontstaan, omdat de laag die net is neergelegd al aan het afkoelen is voor dat de volgende de volgende laag daar op wordt gelegd. Tijdens het testen op een conventionele printer is vastgesteld dat dat inderdaad een probleem is, zie Figuur 1.2 voor een foto van de krom getrokken prints.

2 EISEN VAN HET PROJECT

2.0.1 RANDVOORWAARDEN

Het frame van een Ender-5, de motoren van de Ender-5, de behuizing, de warmte-elementen en de positie daar van waren allemaal al ontworpen voordat aan het project was begonnen. Dus deze aspecten van het project konden in principe niet veranderen.

2.0.2 FUNCTIONELE WENSEN

De verwarmde kamer van de printer moet maximaal 160 °C kunnen worden en stabiel zijn bij elke ingestelde temperatuur

2.0.3 GEBRUIKERSWENSEN

De gebruikersinterface moet een eenvoudige en snelle manier zijn om de printer te gebruiken, dat betekent in principe dat de printer op dezelfde manier te bedienen moet zijn als de originele Ender-5

2.0.4 ONTWERPBEPERKINGEN

Het project moet worden gedaan in 10 weken. Dus er kunnen geen onderdelen worden gebruikt met een lange levertijd.

De extruder en hotend kunnen niet op de conventionele manier worden gekoeld omdat dezen zich in de verwarmde kamer bevinden. Dus als blijkt dat dezen gekoeld moeten worden moet daar een andere oplossing voor worden gevonden.

3 PROBLEMEN

Tijdens het project zijn een paar problemen opgetreden. Dezen hadden allemaal te maken met de extruder en dat daar geen plastic meer uit kwam (vast liep).

3.1 SMELTEND PLASTIC IN DE EXTRUDER

Een probleem waar al vrij snel tegen aan werd gelopen is dat de extruder vast liep door dat het plastic te vroeg smolt, met het gevolg er geen plastic meer uit de nozzle kwam. Dit gebeurde telkens rond de zelfde tijd na het starten van een print.

3.1.1 OORZAAK

Dit probleem was het resultaat van warme drive gears (extruder tandwielen). Heat creep is een term voor het warmte gradiënt door de metalen onderdelen van de extruder. De stappenmotor van de extruder en de heater cartridge van het hotend produceren allebei warmte. Deze warmte geleidt door de hele extruder assemblage en komt dus ook bij de drive gears. Als daardoor het plastic ook warm wordt smelt het in de extruder, en kan het dus niet meer door de nozzle worden geperst.

3.2 DUBBELVOUWEND PLASTIC IN DE EXTRUDER

Een probleem tijdens het testen met een PP print was dat het plastic dubbel vouwde in de ruimte tussen de extruder tandwielen en de glijder naar de extruder. Dit is dus een ander probleem dan beschreven in hoofdstuk [3.1](#), dit probleem treedt eerder op en zelfs als de kamer niet is verwarmd. Dit probleem treedt ook op tijdens het testen van PP op een normale printer, echter om een andere reden.

3.2.1 OORZAAK

Dit komt doordat er genoeg ruimte is tussen de extruder tandwielen en het extruder frame zodat er filament tussen door past. En omdat PP veel flexibeler is dan HDPE, gaat het makkelijk daar tussen zitten.

Dit probleem had een andere oorzaak bij het testen op een standaard Ender-3. De oorzaak was echter dat de extruder veel meer kracht zou moeten zetten omdat de Ender-3 een bowden extruder printer is. Uitleg over wat een bowden tube extruder is staat in hoofdstuk [4.1.1](#).

3.3 KAMER TEMPERATUUR OVERSHOOT

De temperatuur van de verwarmde kamer schiet door het setpoint heen voordat het stabiliseert of oscilleert rond de ingestelde waarden

3.3.1 OORZAAK

De massa van de thermistor is zo hoog dat het lang duurt om in evenwicht te komen met de luchttemperatuur. Daarom loopt de gemeten temperatuur dus aanzienlijk achter op de werkelijke temperatuur. De werkelijke temperatuur is geverifieerd door een thermokoppel naast de thermistor te hangen.

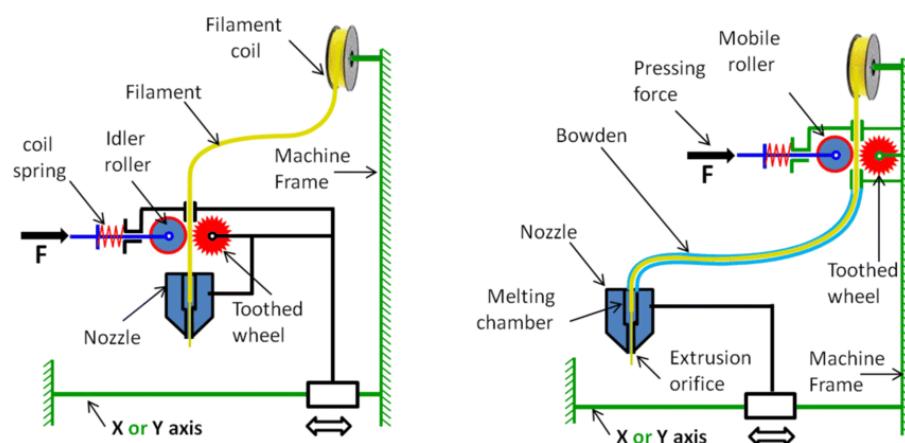

4

MOGELIJKE OPLOSSINGEN

4.1 EXTRUDER PROBLEEMEN

Het probleem van een vastlopende extruder kwam voor met een direct drive extruder. Een oplossing die overwogen was, was het overstappen naar een andere extruder architectuur.

4.1.1 VERSCHILLENDEN SOORTEN EXTRUDERS

Figuur 4.1: Diagram van de twee soorten extruders die veel worden gebruikt [1].

BOWDEN EXTRUDER

De rechter helft van Figuur 4.1 [1] is een diagram van een bowden extruder. Hierbij is te zien dat Sxtruder los is van de Hotend.

DIRECT DRIVE EXTRUDER

De linker helft van Figuur 4.1 [1] is een diagram van een direct drive extruder.

4.1.2 ZOU EEN BOWDEN EXTRUDER DE PROBLEMEN OPLOSSEN

Met een bowden extruder zou het probleem van smeltend plastic in de extruder (Hoofdstuk 3.1) opgelost kunnen worden. Echter was opgemerkt dat PP niet geprint kan worden met een bowden printer (Hoofdstuk 3.2).

4 Mogelijke oplossingen

4.1.3 ZOU EEN WATERGEKOELDE EXTRUDER DE PROBLEEMEN OPLOSSSEN

Een watergekoelde extruder/hotend zou allebei de problemen kunnen oplossen met als enige nadeel extra complexheid in de vorm van aanstuurelektronica en software voor de waterkoeling en de waterkoeling zelf (buizen, pomp, radiator).

Een goede optie zou de "Titan Aqua"[\[5\]](#) zijn.

4.2 TEMPERATUUR OVERSHOOT

Een PID lus voor de kamertemperatuur kan worden geïmplementeerd in de firmware van de printer, het vermogen van de warmte-elementen kan worden teruggedraaid om ervoor te zorgen dat de temperatuur minder snel stijgt en er dus een minder groot verschil is tussen de gemeten en de werkelijke temperatuur.

5 DE GEKOZEN OPLOSSING

Om een oplossing te kiezen is overlegd met het materiaal team, en de opdrachtgever.

5.1 EXTRUDER

Voor de extruder is gekozen om de originele extruder er op te laten zitten, hier voor zijn 2 redenen:

- Er waren geen watergekoelde extruders beschikbaar met een levertijd voor het eind van de stageperiode, echter wordt wel aanbevolen in de toekomst om een water gekoelde extruder te installeren. Dat is ook opgenomen in hoofdstuk 9.
- Tijdens testen is geconcludeerd dat met bepaalde instelling HDPE prima printbaar is. En zeker als een paar massa procent carbon fiber wordt toegevoegd.

5.2 TEMPERATUUR OVERSHOOT

Een PID lus is geïmplementeerd in de firmware, en de autotune feature van Marlin is gebruikt om dezen te tunen.

6

ONTWERP VAN DE OPLOSSING EN DE BENODIGDE ONDERDELEN

6.1 HARDWARE

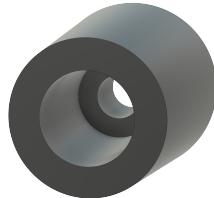

Het mechanisch ontwerp van de printer was grotendeels al gedaan, echter zijn er een aantal aanpassingen gedaan, die staan hier beschreven.

6.1.1 GE-3D-PRINTE OPLOSSINGEN

Een aantal problemen zijn opgelost door kleine onderdelen te 3D-printen. hier zijn daar een paar voorbeelden van.

VOETJES VAN DE PRINTER

De voetjes van de printer waren te kort, dus daar zijn langere voor ontworpen en ge-3D-print. Zie Figuur [6.1](#) voor een render van het 3D ontwerp.

Figuur 6.1: Render van het 3D ontwerp van de voetjes van de printer

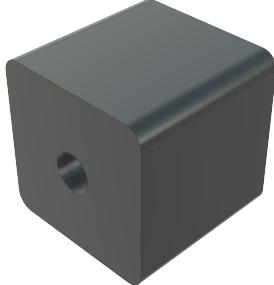

AFSTANDHOUDER

De originele printer is omgebouwd met roestvrijstalen panelen aan alle kanten. Om ervoor te zorgen dat er goede thermische isolatie is van de printkamer, is het een dubbelwandig ontwerp met glaswol er tussen. De dubbele wanden worden op afstand gehouden met ge-3D-prinete afstandhouders. Zie Figuur [6.2](#) voor een render van het 3D ontwerp van deze afstandhouders.

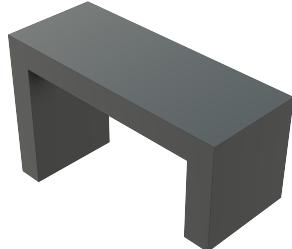

6 Ontwerp van de oplossing en de benodigde onderdelen

HAAKJE

Om de deur dicht te houden is er een haakje geprint. Zie Figuur [6.3](#) voor een render van het 3D ontwerp van het haakje.

Figuur 6.2: Render van het 3D ontwerp van de afstandhouder van de printer

Figuur 6.3: Render van het 3D ontwerp van het haakje van de printer

DIN-RAIL BEVESTIGINGEN

Op de zijkant van de printer was een DIN-rail bevestigd, hierop werd vervolgens alle elektronica bevestigd. In Figuur [6.4](#), [6.5](#) en [6.6](#) zijn de montage stukken te zien voor de PCB en de stroomtoevoer.

Figuur 6.4: Render van het 3D ontwerp van de DIN-rail PCB houder

6.2 ELECTRONICA

De te gebruiken elektronica was grotendeels al vastgesteld voor het project begon. Maar er was vrije keuze voor het hoofdboard, hiervoor is een bigtreeetech SKR-2 gekozen [\[6\]](#). Dit board was gekozen omdat deze vrij nieuw is, makkelijk te gebruiken, en veel mogelijkheden biedt.

Figuur 6.5: Render van het 3D ontwerp van de schakelaarhouder op de DIN-rail

Figuur 6.6: Render van het 3D ontwerp van het haakje van de C-14 houder op de DIN-rail

6.3 SOFTWARE

Onder software word de slicer gezien. Er is gekozen voor prusaslicer, omdat dit een veel gebruikte slicer is die veel opties biedt en gratis (open source) is.

De settings waarmee is getest zijn beschikbaar gesteld voor het team bij 3devo. Zodat zij verder kunnen werken aan de progressie die tijdens de stageperiode is verricht. Dit staat gedocumenteerd in de GitHub repo van het project.

6.4 FIRMWARE

Voor de firmware is Marlin gekozen, en deze is geconfigureerd om te werken met de hardware (elektronica/stappenmotoren/sensoren) van de printer. Dit staat gedocumenteerd in de GitHub repo van het project.

7

ASSEMBLAGE

7.1 ASSEMBLAGE VAN DE PRINTER

Het mechanisch ontwerp van de printer was al vastgesteld, de printer hoefde dus alleen nog in elkaar worden gezet. De printer is gebaseerd op de Ender-5, een robuuste printer die een goed platform biedt om een geïsoleerde behuizing eromheen te bouwen. De printer is voorzien van dubbele laser gesnelde wanden met glasfolie daar tussen. Ondanks dat de assemblage van de behuizing niet in de scoop van het project valt, was het wel nodig om verder te gaan met het project, dus dat was als eerste gedaan.

7.1.1 ELEKTRONISCH

Elektronisch gezien moest er voral een hoop cable management gebeuren. En de firmware moet op het bord worden gezet.

7.2 FIRMWARE

De firmware die op het bord draait is een aangepaste versie van Marlin. Marlin is een open source 3D-printer firmware die uitermate geschikt is voor hobby FDM 3D-printers, vanwege de wereldwijde support van vrijwilligers die meehelpen aan het project [3]. De aanpassingen aan de firmware zijn gemaakt in het configuratiebestand, zie bijlagen H en I voor de configuratie.

8

TOETSING EINDRESULTAAT AAN DE HAND VAN DE EISEN

8.1 VEILIGHEID

Er is rekening gehouden met de elektrische veiligheid, in figuur [6.6](#) is bijvoorbeeld te zien hoe een extra kapje is toegevoegd over de blote contacten van de C-14 stekker.

8.2 EENVOUDIGHEID

De printer is makkelijk te gebruiken aan de hand van de handleiding, zie bijlage [G](#).

8.3 OVERIG

De printer voldoet ook aan de andere eisen.

9

CONCLUSIE EN AANBEVELINGEN

Uit dit verslag kan geconcludeerd worden dat dit project geslaagd is omdat het product op tijd werd opgeleverd, en voldoet aan alle gestelde eisen.

Echter zijn er wel wat aandachtspunten, zoals dat de printkwaliteit niet volledig naar wens is, daarom is de aanbeveling aan 3devo om:

- Een watergekoelde extruder te installeren
- De printer beter te tunen om met gewenste kwaliteit te printen.

Appendices

A INTERVISIE

Student over Intervisie bedrijf			
Naam bedrijf		EFPC	
Vestigingsplaats		De Bilt	
Bedrijfsbegeleider		Ronald van brakel	
Naam student		Menno Hondius	
Datum		11-10-21	
Type bedrijfservaring	<input type="radio"/> eerste stage	<input checked="" type="radio"/> tweede stage	<input type="radio"/> afstuderen

Omschrijving van de verrichte werkzaamheden:

Inzicht verkrijgen in brand risico als gevolg van zonen installaties op fabriek daken. De installatie van zonnepanelen heeft een bepaald risicoprofiel waarbij elektriciteit een bepaalde rol heeft.

Omschrijving van de werkomgeving en/of de werksfeer:

Informeel, begeleider makkelijk aan te spreken. Altijd vragen om hulp en veel mensen met kennis om vragen aan te stellen.

Algemene indruk en/of bijzonderheden van de stage:

Er is een cursus ruimte waar sprinkler cursussen worden georganiseerd.

Omschrijving van de verrichtte werkzaamheden:

Werken aan prototypen 3D-printer

Omschrijving van de werkomgeving en/of de werksfeer:

De werkomgeving bij 3devo is relaxed, er wordt van je verwacht dat je goed werk levert, maar er wordt absoluut niet gemicromanaged

Algemene indruk en/of bijzonderheden van de stage:

Ik heb nou samengewerkt met het materiaal team, en minder met mijn begeleider die elektronica ontwerp doet

E VERANTWOORDING VAN DE BEHAALDE COMPETENTIES

verantwoording van de behaalde competenties

Realiseren

- Ik heb de printer opgeleverd die voldoet aan de gestelde eisen.
- IK heb daarvoor de printer in elkaar moeten zetten, en sommige onderdelen zelf moeten produceren.
- Ik heb de printer getest met meerdere materialen.
- Ik heb een verslag opgeleverd met daarin documentatie van het realisatieproces.

Professionaliseren

- Ik ben zelfstandig te werk gegaan met het project.
- Ik ben flexibel geweest op kantoor, door een aantal extra taken op me te nemen.
- Ik heb al mijn beslissingen genomen met de ethiek daar achter in gedachten.
- Ik heb mijn collega's geholpen en geadviseerd met probleem waar zij tegen aan liepen.
- Ik heb de software voor interen communicatie binnen het bedrijf gebruikt, en daar zowel in het Nederlands als in het Engels op gecommuniceerd.

Ontwerpen

- Ik heb de elektronica gekozen die voldoet aan de gestelde eisen.
- In het verslag is het ontwerp beschreven.
- Het ontwerp is getest aan de hand van de eisen.
- Ik heb documentatie opgeleverd waarmee de opdrachtgever de printer kan gebruiken.

F

KORTE BESCHRIJVING VAN DE BEDRIJFSORGANISATIE

korte beschrijving van de bedrijfsorganisatie

Het bedrijf zit heel gewoontjes in elkaar. er is een baas, hij stuurt een aantal medewerkers aan, die vervolgens ook een aantal medewerkers aansturen. Maar het is ook heel open, iedereen kan aan iedereen om hulp vragen, en dat gebeurt ook regelmatig.

G

OVERDRACHT DOCUMENT

Transfer document for the heated chamber 3D printer (solid-kinetic)

This document describes how the printer can used.

Parts of the printer

- main bord: BigTreeTech SKR 2
- Hotend: E3D Titan Aero 1,75 mm 24V
- Printer platform: Creality 3D Ender-5
- Volume (X, Y, Z): 200x200x300 mm

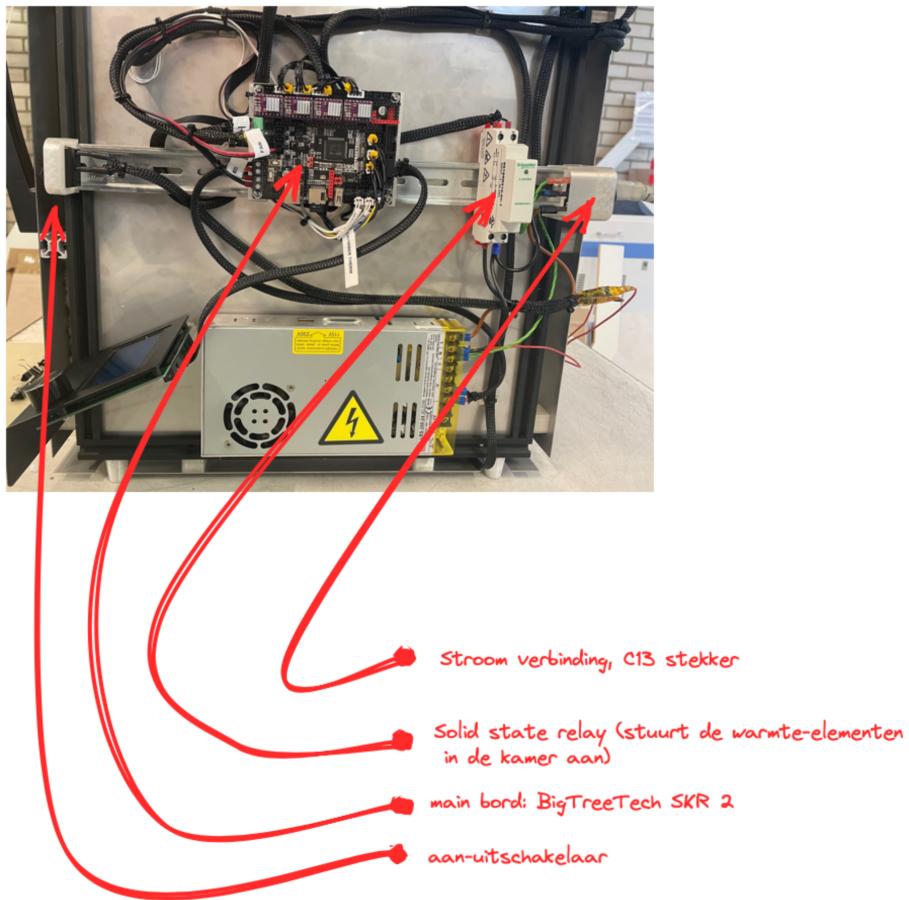

Figure 1: components

What do you have to do to use the printer?

1. Turn on the printer

Is the printer plugged in and the power switch turned on?

2. Slice:

Prusa slicer (or other Slic3r forks)

install: Install the settings files found on GitHub : <https://github.com/lucanatorvs/solid-kinetic> the settings files are in the folder: `slicer_settings/PrusaSlicer` and there are also the installation instructions.

using the slicer: Instructions for the slicer are on the prusa3d website.
<https://www.prusa3d.com/prusaslicer/>

setting up the slicer: The slicer has a number of settings that you can adjust. that is necessary to get good results. But the project defaults on github are good enough to start with.

To completely tune the printer and achieve the best results, you can use the tool by Teaching Tech <https://teachingtechyt.github.io/calibration.html>. Here is clearly documented what you can do to calibrate the printer.

export gcode: From the slicer, you can export the gcode to a micro-SD card. The printer prints directly from the SD card. If you have trouble connecting to the card, try turning the printer off and on, or try reformatting the SD-card to FAT32.

3. printing:

Print from the SD-card. Most print settings can be directly changed during the print from the display.

4. Bed (leveling):

The bed leveling procedure is the same as any other 3D printer. Or use the mesh leveling tool. The bed is covered with PP tape, this can be scraped off and replaced when needed.

5. Filament:

The printer uses 1.75 mm filament. The spool needs to be supported above the printer and the filament needs to be fed through the hole on top of the printer into the E3D Titan Aero extruder-hotend.

6 heated chamber:

The heated chamber can either be controlled from G-CODE or from the printer directly. The G-CODE commands are:

```
M141 S40 ; set chamber temp @ 40  
M191 S40 ; wait for chamber temp @ 40
```

furure improvements

Add a water cooled hotend-extruder.

Figure 2: qrcode to the github repo

Thermistor
457 *
458 * Analog Thermistors – 1kΩ pullup – Atypical, and requires changing out
the 4.7kΩ pullup for 1kΩ.
459 * ----- (but gives greater accuracy and more
stable PID)
460 * 51 : 100kΩ EPCOS (1kΩ pullup)
461 * 52 : 200kΩ ATC Semitec 204GT-2 (1kΩ pullup)
462 * 55 : 100kΩ ATC Semitec 104GT-2 – Used in ParCan & J-Head (1kΩ pullup)
463 *
464 * Analog Thermistors – 10kΩ pullup – Atypical
465 * -----
466 * 99 : 100kΩ Found on some Wanhao i3 machines with a 10kΩ pull-up
resistor
467 *
468 * Analog RTDs (Pt100/Pt1000)
469 * -----
470 * 110 : Pt100 with 1kΩ pullup (atypical)
471 * 147 : Pt100 with 4.7kΩ pullup
472 * 1010 : Pt1000 with 1kΩ pullup (atypical)
473 * 1047 : Pt1000 with 4.7kΩ pullup (E3D)
474 * 20 : Pt100 with circuit in the Ultimainboard V2.x with mainboard ADC
reference voltage = INA826 amplifier-board supply voltage.
475 * NOTE: (1) Must use an ADC input with no pullup. (2) Some
INA826 amplifiers are unreliable at 3.3V so consider using sensor 147, 110,
or 21.
476 * 21 : Pt100 with circuit in the Ultimainboard V2.x with 3.3v ADC
reference voltage (STM32, LPC176x....) and 5V INA826 amplifier board supply.
477 * NOTE: ADC pins are not 5V tolerant. Not recommended
```

```

+/-           NOTE: ADC pins are not yet calibrated, NOT RECOMMENDED
because it's possible to damage the CPU by going over 500°C.
478 *   201 : Pt100 with circuit in Overlord, similar to Ultimainboard V2.x
479 *
480 * Custom/Dummy/Other Thermal Sensors
481 * -----
482 *   0 : not used
483 * 1000 : Custom - Specify parameters in Configuration_adv.h
484 *
485 * !!! Use these for Testing or Development purposes. NEVER for production
machine. !!!
486 * 998 : Dummy Table that ALWAYS reads 25°C or the temperature defined
below.
487 * 999 : Dummy Table that ALWAYS reads 100°C or the temperature defined
below.
488 *

1148 *
1149 * Z offset
1150 * - For the Z offset use your best known value and adjust at runtime.
1151 * - Common probes trigger below the nozzle and have negative values for Z
1152 offset.
1153 * - Probes triggering above the nozzle height are uncommon but do exist.
When using
1153 * probes such as this, carefully set Z_CLEARANCE_DEPLOY_PROBE and
Z_CLEARANCE_BETWEEN_PROBES
1154 * to avoid collisions during probing.
1155 *
1156 * Tune and Adjust
1157 * - Probe Offsets can be tuned at runtime with 'M851', LCD menus,
babystepping, etc.
1158 * - PROBE_OFFSET_WIZARD (configuration_adv.h) can be used for setting the
Z offset.
1159 *
1160 * Assuming the typical work area orientation:
1161 * - Probe to RIGHT of the Nozzle has a Positive X offset
1162 * - Probe to LEFT of the Nozzle has a Negative X offset
1163 * - Probe in BACK of the Nozzle has a Positive Y offset
1164 * - Probe in FRONT of the Nozzle has a Negative Y offset
1165 *
1166 * Some examples:
1167 * #define NOZZLE_TO_PROBE_OFFSET { 10, 10, -1 } // Example "1"
1168 * #define NOZZLE_TO_PROBE_OFFSET {-10, 5, -1 } // Example "2"
1169 * #define NOZZLE_TO_PROBE_OFFSET { 5, -5, -1 } // Example "3"
1170 * #define NOZZLE_TO_PROBE_OFFSET {-15,-10, -1 } // Example "4"
1171 *
1172 *      +--- BACK ---+
1173 *      | [+]   |
1174 *      L |       1 | R <-- Example "1" (right+, back+)
1175 *      E | 2     | I <-- Example "2" ( left-, back+)
1176 *      F | [-] N | [+]| G <-- Nozzle
1177 *      T |       3 | H <-- Example "3" (right+, front-)
1178 *      | 4     | T <-- Example "4" ( left-, front-)
1179 *      | [-]   |
1180 *      0-- FRONT --+

1505 * Choose one of the options below to enable G29 Bed Leveling. The
1506 * parameters
1507 * and behavior of G29 will change depending on your selection.
1508 *
1509 * If using a Probe for Z Homing, enable Z_SAFE_HOMING also!
1510 ..
```

```

1510 *
1511 * - AUTO_BED_LEVELING_3POINT
1512 *   Probe 3 arbitrary points on the bed (that aren't collinear)
1513 *   You specify the XY coordinates of all 3 points.
1514 *   The result is a single tilted plane. Best for a flat bed.
1515 *
1516 * - AUTO_BED_LEVELING_LINEAR
1517 *   Probe several points in a grid.
1518 *   You specify the rectangle and the density of sample points.
1519 *   The result is a single tilted plane. Best for a flat bed.
1520 *
1521 * - AUTO_BED_LEVELING_BILINEAR
1522 *   Probe several points in a grid.
1523 *   You specify the rectangle and the density of sample points.
1524 *   The result is a mesh, best for large or uneven beds.
1525 *
1526 * - AUTO_BED_LEVELING_UBL (Unified Bed Leveling)
1527 *   A comprehensive bed leveling system combining the features and benefits
1528 *   of other systems. UBL also includes integrated Mesh Generation, Mesh
1529 *   Validation and Mesh Editing systems.
1530 *
1531 * - MESH_BED_LEVELING
1532 *   Probe a grid manually
1533 *   The result is a mesh, suitable for large or uneven beds. (See
1534 *   BILINEAR.)
1535 *   For machines without a probe, Mesh Bed Leveling provides a method to
1536 *   perform
1537 *   leveling in steps so you can manually adjust the Z height at each grid-
1538 *   point.
1539 *   With an LCD controller the process is guided step-by-step.

1758 * Bed Skew Compensation
1759 *
1760 * This feature corrects for misalignment in the XYZ axes.
1761 *
1762 * Take the following steps to get the bed skew in the XY plane:

```

```

1761 * 1. Print a test square (e.g., https://www.thingiverse.com/thing:2563185)
1762 * 2. For XY_DIAG_AC measure the diagonal A to C
1763 * 3. For XY_DIAG_BD measure the diagonal B to D
1764 * 4. For XY_SIDE_AD measure the edge A to D
1765 *
1766 * Marlin automatically computes skew factors from these measurements.
1767 * Skew factors may also be computed and set manually:
1768 *
1769 * - Compute AB      : SQRT(2*AC*AC+2*BD*BD-4*AD*AD)/2
1770 * - XY_SKEW_FACTOR : TAN(PI/2-ACOS((AC*AC-AB*AB-AD*AD)/(2*AB*AD)))
1771 *
1772 * If desired, follow the same procedure for XZ and YZ.
1773 * Use these diagrams for reference:
1774 *
1775 *      Y          Z          Z
1776 *      ^          ^          ^
1777 *      |          |          |
1778 *      |          /          /
1779 *      |          |          /

1908 *     P  Pattern
1909 *     S  Strokes / Repetitions
1910 *     T  Triangles (P1 only)
1911 *
1912 * Patterns:
1913 *     P0  Straight line (default). This process requires a sponge type
1914 *         material
1915 *             at a fixed bed location. "S" specifies strokes (i.e. back-forth
1916 *             motions)
1917 *                 between the start / end points.
1918 *
1919 *     P1  Zig-zag pattern between (X0, Y0) and (X1, Y1), "T" specifies the
1920 *         number of zig-zag triangles to do. "S" defines the number of
1921 *         strokes.
1922 *             Zig-zags are done in whichever is the narrower dimension.
1923 *             For example, "G12 P1 S1 T3" will execute:
1924 *
1925 *             -- ... . . . .. . . . .. . . . .. . . . .. . . . ..

```

```

1920 *
1921 *
1922 *
1923 *
1924 *
1925 *
1926 *
1927 *
1928 *
1929 * P2 Circular pattern with middle at NOZZLE_CLEAN_CIRCLE_MIDDLE.
1930 * "R" specifies the radius. "S" specifies the stroke count.
1931 * Before starting, the nozzle moves to NOZZLE_CLEAN_START_POINT.
1932 *
1933 * Caveats: The ending Z should be the same as starting Z.
1934 * Attention: EXPERIMENTAL. G-code arguments may change.

350         #define LPQ_MAX_LEN 50
351     #endif

352     /**
353     * Add an experimental additional term to the heater power, proportional
354     // to the fan speed.
355     * A well-chosen Kf value should add just enough power to compensate for
356     // power-loss from the cooling fan.
357     * You can either just add a constant compensation with the DEFAULT_Kf
358     // value
359     * or follow the instruction below to get speed-dependent compensation.
360     *
361     * Constant compensation (use only with fanspeeds of 0% and 100%)
362     * -----
363     * A good starting point for the Kf-value comes from the calculation:
364     * kf = (power_fan * eff_fan) / power_heater * 255
365     * where eff_fan is between 0.0 and 1.0, based on fan-efficiency and
366     // airflow to the nozzle / heater.
367     *

```

```

363 * Example:
364 *   Heater: 40W, Fan: 0.1A * 24V = 2.4W, eff_fan = 0.8
365 *   Kf = (2.4W * 0.8) / 40W * 255 = 12.24
366 *
367 * Fan-speed dependent compensation
368 * -----
369 * 1. To find a good Kf value, set the hotend temperature, wait for it to
370 settle, and enable the fan (100%).
371 *   Make sure PID_FAN_SCALING_LIN_FACTOR is 0 and
372 PID_FAN_SCALING_ALTERNATIVE_DEFINITION is not enabled.
373 *   If you see the temperature drop repeat the test, increasing the Kf
374 value slowly, until the temperature
375 *   drop goes away. If the temperature overshoots after enabling the
376 fan, the Kf value is too big.
377 * 2. Note the Kf-value for fan-speed at 100%
378 * 3. Determine a good value for PID_FAN_SCALING_MIN_SPEED, which is
379 around the speed, where the fan starts moving.
380 * 4. Repeat step 1. and 2. for this fan speed.
381 * 5. Enable PID_FAN_SCALING_ALTERNATIVE_DEFINITION and enter the two
382 identified Kf-values in
383 *   PID_FAN_SCALING_AT_FULL_SPEED and PID_FAN_SCALING_AT_MIN_SPEED.
384 Enter the minimum speed in PID_FAN_SCALING_MIN_SPEED

542 * FAST PWM FAN Settings
543 *
544 * Use to change the FAST FAN PWM frequency (if enabled in Configuration.h)
545 * Combinations of PWM Modes, prescale values and TOP resolutions are used
internally to produce a
546 * frequency as close as possible to the desired frequency.
547 *
548 * FAST_PWM_FAN_FREQUENCY [undefined by default]
549 * Set this to your desired frequency.
550 * If left undefined this defaults to F = F_CPU/(2*255*1)
551 * i.e., F = 31.4kHz on 16MHz microcontrollers or F = 39.2kHz on 20MHz
microcontrollers.

```

```

552 * These defaults are the same as with the old FAST_PWM_FAN implementation
553 - no migration is required
554 * NOTE: Setting very low frequencies (< 10 Hz) may result in unexpected
555 timer behavior.
556 *
557 * USE_OCR2A_AS_TOP [undefined by default]
558 * Boards that use TIMER2 for PWM have limitations resulting in only a few
559 possible frequencies on TIMER2:
560 * 16MHz MCUs: [62.5KHz, 31.4KHz (default), 7.8KHz, 3.92KHz, 1.95KHz,
561 977Hz, 488Hz, 244Hz, 60Hz, 122Hz, 30Hz]
562 * 20MHz MCUs: [78.1KHz, 39.2KHz (default), 9.77KHz, 4.9KHz, 2.44KHz,
563 1.22KHz, 610Hz, 305Hz, 153Hz, 76Hz, 38Hz]
564 * A greater range can be achieved by enabling USE_OCR2A_AS_TOP. But note
565 that this option blocks the use of
566 * PWM on pin OC2A. Only use this option if you don't need PWM on OC2A.
567 (Check your schematic.)
568 * USE_OCR2A_AS_TOP sacrifices duty cycle control resolution to achieve
569 this broader range of frequencies.

658 * Dual Steppers / Dual Endstops
659 *
660 * This section will allow you to use extra E drivers to drive a second
661 motor for X, Y, or Z axes.
662 *
663 * For example, set X_DUAL_STEPPER_DRIVERS setting to use a second motor. If
664 the motors need to
665 * spin in opposite directions set INVERT_X2_VS_X_DIR. If the second motor
666 needs its own endstop
667 * set X_DUAL_ENDSTOPS. This can adjust for "racking." Use X2_USE_ENDSTOP to
668 set the endstop plug
669 * that should be used for the second endstop. Extra endstops will appear in
670 the output of 'M119'.
671 *
672 * Use X_DUAL_ENDSTOP_ADJUSTMENT to adjust for mechanical imperfection.
673 After homing both motors
674 * this offset is applied to the X2 motor. To find the offset home the X
675 axis, and measure the error
676 * in X2. Dual endstop offsets can be set at runtime with 'M666 X<offset>
677 Y<offset> Z<offset>'.

 * Dual X Carriage
 *
 * This setup has two X carriages that can move independently, each with its
own hotend.
 * The carriages can be used to print an object with two colors or
materials, or in
 * "duplication mode" it can print two identical or X-mirrored objects
simultaneously.
 * The inactive carriage is parked automatically to prevent oozing.
 * X1 is the left carriage, X2 the right. They park and home at opposite
ends of the X axis.
 * By default the X2 stepper is assigned to the first unused E plug on the
board.
 *
 * The following Dual X Carriage modes can be selected with M605 S<mode>:
 *
 * 0 : (FULL_CONTROL) The slicer has full control over both X-carriages
and can achieve optimal travel
 *      results as long as it supports dual X-carriages. (M605 S0)
 *
 * 1 : (AUTO_PARK) The firmware automatically parks and unparks the X-
carriages on tool-change so
 *      that additional slicer support is not required. (M605 S1)
 *
 * 2 : (DUPLICATION) The firmware moves the second X-carriage and extruder
in synchronization with
 *      the first X-carriage and extruder, to print 2 copies of the same
object at the same time.

```

```

744 *      Set the constant X-offset and temperature differential with M605 S2
745 X[offs] R[deg] and
746 *      follow with M605 S2 to initiate duplicated movement.
747 *
748 * 3 : (MIRRORED) Formbot/Vivedino-inspired mirrored mode in which the
749 second extruder duplicates
750 *      the movement of the first except the second extruder is reversed in
751 the X axis.
752 *      Set the initial X offset and temperature differential with M605 S2
753 X[offs] R[deg] and
754 *      follow with M605 S3 to initiate mirrored movement.

1410 * Sort SD file listings in alphabetical order.
1411 *
1412 * With this option enabled, items on SD cards will be sorted
1413 * by name for easier navigation.
1414 *
1415 * By default...
1416 *
1417 * - Use the slowest -but safest- method for sorting.
1418 * - Folders are sorted to the top.
1419 * - The sort key is statically allocated.
1420 * - No added G-code (M34) support.
1421 * - 40 item sorting limit. (Items after the first 40 are unsorted.)
1422 *
1423 * SD sorting uses static allocation (as set by SDSORT_LIMIT), allowing
the
1424 * compiler to calculate the worst-case usage and throw an error if the
SRAM
1425 * limit is exceeded.
1426 *
1427 * - SDSORT_USES_RAM provides faster sorting via a static directory
buffer.
1428 * - SDSORT_USES_STACK does the same, but uses a local stack-based
buffer.
1429 * - SDSORT_CACHE_NAMES will retain the sorted file listing in RAM.
(Expensive!)
1430 * - SDSORT_DYNAMIC_RAM only uses RAM when the SD menu is visible. (Use
with caution!)
